.0.x In the network share, there is a folder called VMware vSphere Server and there is one file called license.lic. Inside this file you should have the necessary information you need. Remember, the VIB has to be uninstalled and reinstalled for each new product installed. For the VMware virtual appliance, the VIB can be a packaged file downloaded directly from the VMware website. Virtual Appliance Licenses Virtual appliance licenses come in a variety of flavors. There are any-to-any licenses, one-to-many licenses, many-to-one licenses, and any-to-one licenses. With an any-to-any license, you can install as many virtual appliances as you want to use on your cluster and all are considered to be one machine. This method is best for some type of testing where you don't care about the exact number of virtual machines that you have installed. The one-to-many method requires a different set of licenses. The new virtual appliance can be installed in a cluster and the existing virtual appliance can still be installed on other clusters. This method is best for environments that must have a specific set of virtual machines that cannot be shared with any other clusters. Many-to-one and any-to-one licenses are similar to the one-to-many and any-to-any licenses, but the difference is the number of virtual machines that are installed in the cluster. Any-to-one licenses can be used to install virtual appliances for a specific cluster or for many clusters. The cluster that the virtual appliance will be installed on is determined when the virtual appliance is deployed. The license type is determined when the virtual appliance is deployed. There are three types of license types that can be used with vSphere: vCenter Server Plus, Infrastructure Services, and ESXi. To determine what type of license is used for an ESXi, you can use the following command: ESXi Host Type | License Type --- | --- Host | License vCenter Server Plus Guest | License Infrastructure Services If you are installing ESXi on a Linux machine, you don't have to worry about a license. The Linux guest virtual machine runs as a non-privileged user in the Linux host and there is no need for a license. vCenter Server Licenses When the VMware virtual appliance is installed, the license is placed in a special folder. This folder is named cVMware 82157476af
